

EHV CABLE SYSTEM

66~500kV XLPE Cable & Accessories

THE WORLD BEST CABLE SOLUTION LEADER

LS Cable & System supplies various cables and materials used for power grids and communication networks around the world across all industries providing its top class technology and excellent quality. The company has also developed state of the art products, such as superconductors, HVDC and submarine cables that will lead the future energy industry.

LS spun off from LG in 2003 as a group specializing in electronics, electrical systems, energy and materials.

LS EHV Cable System

66~500kV XLPE Cable & Accessories

Our Philosophy

At LS Cable & System, we understand our responsibility and our potential in leading society to remarkable improvements in varied facets of human life and society. For the past many decades we successfully took the challenge of providing our clients with solutions and support systems to service their globe-spanning businesses. We recognize the significance of our contributing customer-oriented services for the betterment of the society and its operations. We believe that our responsibility should not end in mere execution of our customers' project, but should extend towards contributing our knowledge and expertise in returning value to their company and to the society within which they live. Our vision is to provide world class services and products to our clients with a sense of responsibility and accountability towards them, their employees and ultimately the society. We are determined to shoulder our responsibility of serving the society by protecting the environment. We bear the vision of alleviating the ill-effects on the ecosystem and human life using more advanced technology. We are persistently in the process of putting our philosophy in action.

Total Solution for Underground Transmission System

LS Cable & System is one of the world's leading manufacturers of extra high voltage cable and accessories and also one of a few total solution providers of underground transmission system. We are prominently capable and facilitated in researching, designing, developing, and manufacturing products and solutions with a heritage of decades as a cable manufacturer and ceaseless invest on quality control.

We provide power system from 66kV ~ 500kV such as XLPE cables, terminations, joints and other related products as some parts of our total solution maximizing the competitive advantage in 230kV and higher voltage system. Especially, the certificate for the satisfactory completion of Type Test and Pre-qualification Test by KEMA lasted for 365 days in 400kV XLPE cable and accessories and shows the quality of full range of our products and system.

Contents

Commitment to Our Customers

As an extra high voltage cable and accessories manufacturer and a division of LS Cable & System, we never stop researching, designing, developing, and manufacturing products with the higher level of quality to address the ever-changing demands in everyday life as well as in the industry. Our quality control meets the most delicate requirements of international standards and the high level of quality is recognized both by local and international clients. Our commitment to develop and deliver solutions to address our customers' needs and challenges keep our technology on the cutting edge and our know-how in the field more valuable, which our customers highly appreciate. We are looking forward to working with you.

1.00 Design & Construction of XLPE Cable

Structure of XLPE Cable

The XLPE Cable has the construction of a conductor (copper or aluminum) insulated with the cross-linked polyethylene and then shielded with metallic screen (corrugated and seamless aluminum or wire shield), to be covered by PVC or polyethylene for anti-corrosion.

Insulation

The insulation material is extruded cross-linked polyethylene. The conductor screen, the insulation and the insulation screen mentioned to the following clause are extruded simultaneously in one process to ensure that the screen and insulation are intimately bonded together and free from all possibilities of voids between layers.

The extrusion process is carried out under strictly controlled atmospheric conditions.

The thickness of the insulation layer is the maximum value figured out from the design of the impulse voltage and A.C. voltage.

The conventional cross-linking process by saturated steam has frequently caused deterioration of the electrical characteristics of the insulation as treeing phenomena arose when put to use for long time. But the new process by N₂ gas has enabled to protect the electrical characteristics from being deteriorated and to lessen the thickness of the insulation and accordingly the cable's outer diameter itself.

Insulation Screen

The insulation screen is provided over the insulation by extruding the semi-conducting compound concentrically and circularly to minimize the possibility of ionization on the outer surface of the dielectric.

Metallic Screen

The metallic screen consists of the wire shield, the corrugated aluminum sheath or the lead sheath. The corrugated aluminum sheath and the lead sheath is also adopted where the surface of duct is poor and where moisture is high.

Outer Sheath

To protect the metallic sheath from electrical or chemical corrosion, it is covered by PE or PVC.

Conductor

The conductor consists of annealed copper or hard aluminum stranded wires and classified into three (3) major types of concentric, compacted circular and segmental compacted circular.

The concentric is the wires wound up concentrically, the compacted circular conductor consists of segments wound up and then compacted. Normally the segmental compacted circular conductor has four (4) segments and is applied for the cross-section over than 800mm², to prevent the increase of A.C. resistance caused by skin effect. When the conductor's cross-section is less than 630mm², the compacted circular is applied generally.

Conductor Screen

The conductor screen consists of an extruded semi-conducting polyethylene to minimize electrical stresses due to the stranded configuration of the conductor. The semi-conducting material used for conductor screen has no deleterious effect on the conductor. Semi-conducting tape is sometimes applied as a separator.

Corrugated Aluminum Sheath Cable

Smooth Welded Aluminum Sheath Cable

Lead Sheath Cable

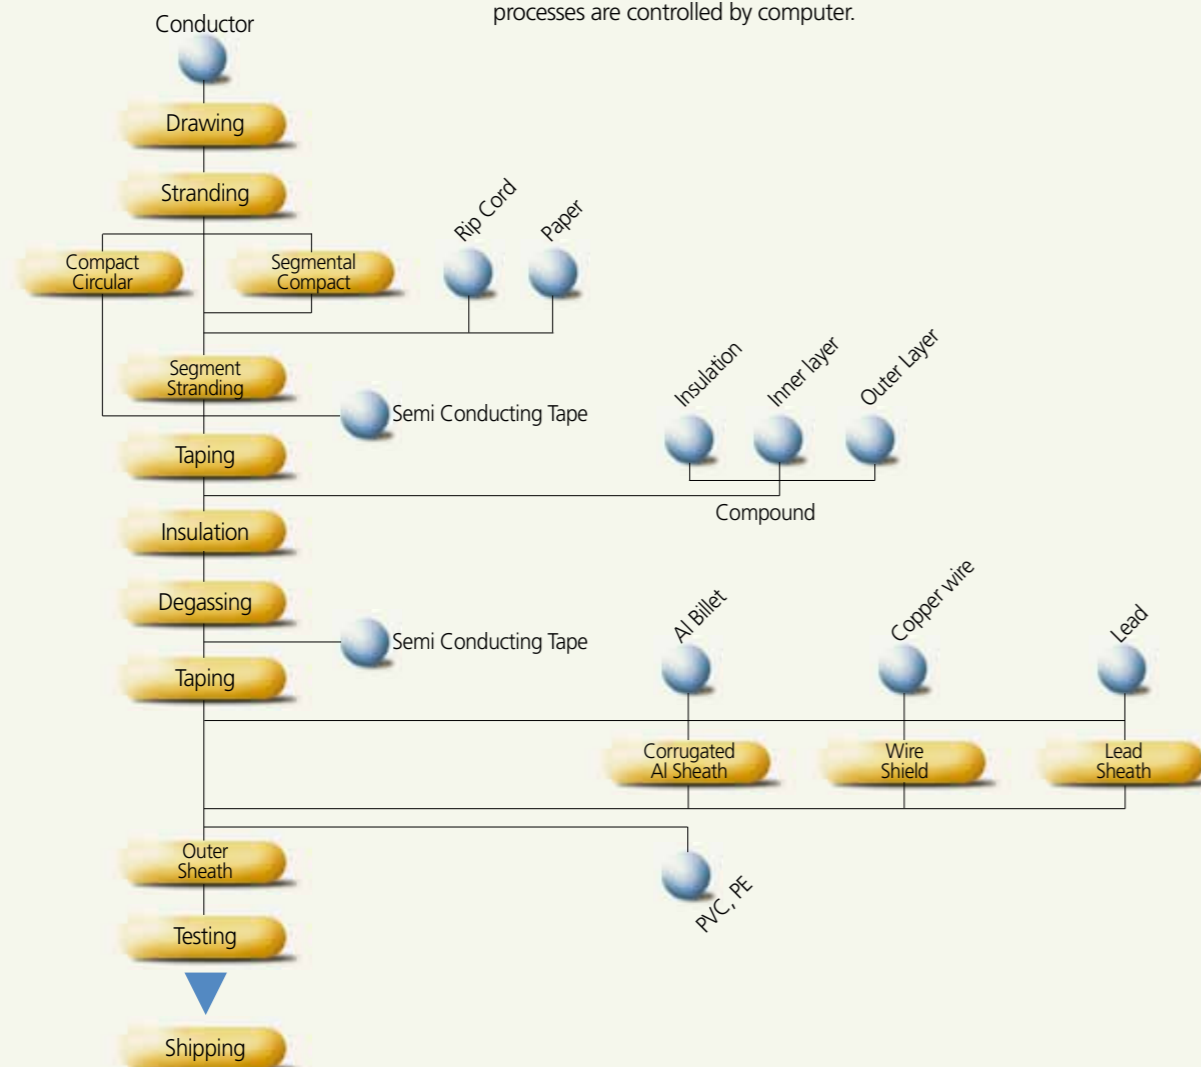

Copper Wire Shield Cable

2.00 Manufacturing Process & VCV Line

The system adopted for insulation of the XLPE Cable is VCV and N₂ gas is used for cross linking, and the line is extruded in a vertical type. The outstanding characteristics of the XLPE Cable manufactured in application of this system are :

1. The insulation has no eccentricity.
2. The cross-linking by use of N₂ gas guarantees excellent electrical characteristics of the insulation.
3. The simultaneous extrusion of the inner and outer semi-conducting layers and the insulation prevents treeing and other irregularities.
4. Uniformity of quality is maintained of all products as the manufacturing processes are controlled by computer.

Extrusion

The conductor screen, the insulation and the insulation screen are simultaneously extruded with the compounds supplied from the clean room.

Cross-Linking and Cooling

The cross-linking takes place in curing zone of A by circulating N₂ gas and the insulation is formed into core through precooling zone of B and cooling zone of C.

Pay Off

The conductor wound up around the drum is set at pay off to run to metering capstan.

Take Up

The cable comes to be wound up again around the drum to go into the next process.

3.00 Cable Construction & Continuous Current Ratings

The continuous current capacity is calculated in accordance with IEC 60287.

Laying Conditions

- 1) Ground Temperature : 25°C
- 2) Depth of Laying : 1.5m
- 3) Soil Thermal Resistivity : 1.0°Cm/W
- 4) Ambient Temperature : 40°C
- 5) Max. Conductor Temperature : 90°C
- 6) Cable Formation : Flat (S=2D)
S : Distance between cables / D : Cable diameter
- 7) Frequency : 50Hz
- 8) Load factor : 100%

Maximum Permissible Conductor Temperature

Normal Operation	Emergency Operation	Short Circuit
90°C	105°C	250°C

- 1) Normal Operation
Normal operation is meant to be maintained through out a given period of time everyday or continuously, without affecting the operation.
- 2) Emergency Load
Emergency load is meant to be maintained for a short time under the condition of system breakdown or under the state of excessively loaded operation, without causing a defect.
- 3) Short Circuit
Short circuit is meant to cause no defect of the cable when an irregular current, flows for short time due to shorting or earthing.

4.00 XLPE Insulated Cables

- 4.01 36/66 (72.5)kV with Corrugated Aluminum Sheath

5.00 Correction Factors for Various Laying Conditions

To determine current capacity for the various laying conditions than those indicated on the every tables, multiply table values by the correction factors shown below.

Correction Factors for Various Ambient Air Temperature

Air Temperature (°C)	20°C	25°C	30°C	35°C	40°C	45°C	50°C
Rating Factor	1.2	1.16	1.10	1.05	1.0	0.94	0.88

Correction Factors for Various Ground Temperature

Air Temperature (°C)	15°C	20°C	25°C	30°C	35°C	40°C	45°C
Rating Factor	1.08	1.04	1.0	0.96	.091	0.87	0.83

Correction Factors for Various Thermal Resistivity of Ground

Thermal Resistivity of Soil (°Cm/W)	0.7	1.0	1.2	1.5	2.0	2.5	3.0
Rating Factor	1.14	1.0	0.93	0.84	0.74	0.67	0.61

Correction Factors for Various Depth of Laying

Depth of Laying (m)	Rating Factor
0.50 ~ 0.70	1.09
0.71 ~ 0.90	1.05
0.91 ~ 1.10	1.03
1.11 ~ 1.30	1.01
1.31 ~ 1.50	1.00

6.00 Permissible Short Circuit Currents

The permissible short circuit current of a cable is determined by the maximum permissible conductor temperature and by the duration of the short circuit current. At high peak currents, the dynamic forces between the conductors must be taken into account.

The short circuit capacity of the conductor and metallic shield of a cable are related principally to their heat capacities and are limited by the maximum temperature permitted under short circuit XLPE power are as follow.

From the two graphs, the short circuit capacity of copper or aluminum conductors (based on a temperature rise from 90°C to 250°C) can be determined.

Logarithmic interpolation between the curves will give estimated values for the various duration.

The curves may be used also to determine the amount of conducting material required to carry a known short circuit current for a given duration.

Copper Conductor

According to IEC 60949 curves based on formula

$$I_s = \varepsilon \times 226 \frac{S}{\sqrt{t}} \sqrt{\ln \frac{\theta_f + 234.5}{\theta_i + 234.5}}$$

where,

I_s = Permissible Short Circuit Current (A)

ε = Factor to allow for heat loss into the Adjacent Components

S = Cross-Sectional Area of Conductor (mm²)

t = Duration of Short Circuit (s)

θ_f = Final Temperature (250°C)

θ_i = Initial Temperature (90°C)

Aluminum Conductor

According to IEC 60949 curves based on formula

$$I_s = \varepsilon \times 148 \frac{S}{\sqrt{t}} \sqrt{\ln \frac{\theta_f + 228}{\theta_i + 228}}$$

where,

I_s = Permissible Short Circuit Current (A)

ε = Factor to allow for heat loss into the Adjacent Components

S = Cross-Sectional Area of Conductor (mm²)

t = Duration of Short Circuit (s)

θ_f = Final Temperature (250°C)

θ_i = Initial Temperature (90°C)

7.01 Outdoor Terminations for 66kV~110kV

7.00 Accessories for EHV Cable Systems

LS Cable & System has developed and manufactured a wide range of terminations and joints for Extra High Voltage(EHV) cable system since 1983. Prefabricated terminations and tape molded joints are installed for 154kV cable system in domestic market. A new advanced accessories, which is called prefabricated and premolded joints, were developed and supplied to many countries in the world. Cable systems from 132kV up to 400kV has been certified through the type test by many international independent institutes (KEMA, CESI, KERI).

Pre-qualification tests for 345kV and 400kV cable systems in accordance with latest IEC standard were carried out successfully by the KEMA and KERI.

- 7.01 Outdoor Terminations for 66kV~110kV
- 7.02 Outdoor Terminations for 132kV~275kV
- 7.03 Outdoor Terminations for 345kV~500kV

- 7.04 SF₆ Gas Insulated Terminations
- 7.05 Oil-Immersed Terminations

- 7.06 Pre-Moulded Joint (PMJ)
- 7.07 Link Box

- 7.08 Transition Joint
- 7.09 Optical Cable & Joint

Figure 1

Figure 2

7.02 Outdoor Terminations for 132kV~275kV

The outdoor terminations for 66~110kV are classified on two types. One is based on silicone rubber sleeve (so called Pre-moulded type, Figure1). The other is based on silicone rubber housing (so called dry type, Figure2). Pre-moulded silicone rubber sleeve is designed to fit with controlled interference over the cable insulation and is able to follow the cable's diameter variations still guaranteeing under any service condition a sufficient positive pressure to control the electric field concentration. This uses elastic retention of silicone material itself. The termination is filled with an insulating compound up to a level where the electric field is substantially reduced. The termination base plate and the cable's metallic sheath are electrically insulated

from the supporting structure by means of stand off insulators designed to withstand both mechanical and electrical stresses in services. Upon request of the customer, either porcelain or composite hollow insulator can be supplied. And the insulator can be supplied in brown or grey color. The maximum allowable cable conductor size is 3000mm²(6000kcmil). The latter uses pre-moulded silicone housing with built in sleeve. They completely free from any liquid insulating materials. The high electrical field area of the termination surface covered with skirts.

The housing is whole preformed and can be supplied in grey color. This has advantage like easier installation. The maximum allowable cable conductor size 3000mm²(6000kcmil). The main insulation components are fully examined and tested in the factory.

Rating & Dimension(Based on pre-moulded type)

Max. Voltage	BIL	Max. Height	Max. Weight	Max. Creepage Distance
kV	kV	mm	kg	mm
72.5	325	1000	100	2500
123	550	1500	200	4300

Rating & Dimension(Based on Dry type)

Max. Voltage	BIL	Max. Height	Max. Weight	Max. Creepage Distance
kV	kV	mm	kg	mm
72.5	325	980	100	2500
123	550	1350	200	4300

Selection of insulators with respect to polluted conditions (Based on IEC60815)

Pollution	I (Light)	II (Medium)	III (Heavy)	IV (Very Heavy)
Min. Nominal Specific Creepage Distance	16mm/kV	20mm/kV	25mm/kV	31mm/kV

Figure 3

Figure 4

7.03 Outdoor Terminations for 345kV~500kV

The outdoor termination for 132~275kV is classified into two types. One is based on the EPR-based rubber stress relief cone with an epoxy housing (so called pre-fabricated type, figure3). The other is based on the silicone rubber sleeve (so called pre-moulded type, figure4).

The former uses mechanical devices to maintain the interface pressure. The latter uses elastic retention of silicone material itself. Pre-moulded silicone rubber sleeve is designed to fit with controlled interference over the cable insulation and is able to follow the cable's diameter variations still guaranteeing under any service condition a sufficient positive pressure to control the electric field concentration.

The termination base plate and the cable's metallic sheath are electrically insulated from the supporting structure by means of stand off insulators designed to withstand both mechanical and electrical stresses in services. Upon request of the customer, either porcelain or composite hollow insulator can be supplied. And the insulator can be supplied in brown or grey colour. In addition upon request of the customer, arcing horn and shield ring can be supplied. The termination is filled with an insulating compound up to a level where the electric field is substantially reduced. The main insulation components are fully examined and tested in the factory. The maximum allowable cable conductor size is 3000mm²(6000kcmil).

Rating & Dimension(Based on pre-moulded type)

Max. Voltage kV	BIL kV	Max. Height mm	Max. Weight kg	Max. Creepage Distance mm
145	650	2410	700	5000
170	750	2410	800	6000
275	1050	3500	900	8400

Selection of insulators with respect to polluted conditions (Based on IEC60815)

Pollution	I (Light)	II (Medium)	III (Heavy)	IV (Very Heavy)

Figure 5

Figure 6

7.04 SF₆ Gas Insulated Terminations

The outdoor termination for 345~500kV is classified into two types. One is based on the EPR-based stress relief cone with the epoxy housing and the oil-impregnated cylindrical capacitor cone is added to secure the uniform longitudinal voltage distribution all along the termination (so called condenser cone type, figure 5). The other is based on silicone rubber sleeve (so called pre-moulded type, figure 6). The former uses mechanical devices to maintain the interface pressure and the latter uses elastic retention of silicone material itself. Pre-moulded silicone rubber sleeve is designed to fit with controlled interference over the cable insulation and is able to follow the cable's diameter variations still guaranteeing under any service condition a sufficient positive pressure to control the electric field concentration. The termination base plate and the cable's metallic sheath are electrically insulated from the supporting structure by means of stand off insulators designed to withstand both mechanical and electrical stresses in services. Upon request of the customer, either porcelain or composite hollow insulator can be supplied. And the insulator can be supplied in brown or grey colour. In addition upon request of the customer, arcing horn and shield ring can be supplied. The termination is filled with an insulating compound up to a level where the electric field is substantially reduced. The main insulation components are fully examined and tested in the factory. The maximum allowable cable conductor size is 3000mm²(6000kcmil).

Rating & Dimension (Based on pre-moulded type)

Max. Voltage kV	BIL kV	Max. Height mm	Max. Weight kg	Max. Creepage Distance mm
362	1175	4300	1700	13000
420	1425	4300	2000	14500

Selection of insulators with respect to polluted conditions (Based on IEC60815)

Pollution	I (Light)	II (Medium)	III (Heavy)	IV (Very Heavy)
Min. Nominal Specific Creepage Distance	16mm/kV	20mm/kV	25mm/kV	31mm/kV

7.05 Oil-Immersed Terminations

The construction of SF₆ gas insulated terminations is based on the EPR(Ethylene-Propylene Rubber) or LSR(Liquid Silicone Rubber) - based stress relief cone and the epoxy resin housing. They are mechanical devices to maintain the interface pressure. Stress relief cone and mechanical devices are designed to fit with controlled interference over the cable insulation and is able to follow the cable's diameter variations still guaranteeing under any service condition a sufficient positive pressure to control the electric field concentration.

They also use epoxy insulating plate to isolate between cable sheath and GIS chamber. The SVLs(Sheath Voltage Limiter) can be installed to protect epoxy insulating plate from switching impulse. Upon request of the customer, we can supply three type of leading conductors. That is normal type, blind-ended type, plug-in type.

Design and scope of delivery are fully complying with IEC60859, IEC62271-209 and possibly adjusted to various needs of customers. The main insulation components are fully examined and tested in the factory. They are currently available at the voltage range up to 500kV and the maximum allowable cable conductor size is 3000mm²(6000kcmil).

Rating & Dimension (Based on IEC 60859)

Max. Voltage	BIL	Max. Height	Dimension of base plate	Max. Weight
kV	kV	mm	mm	kg
72.5	325	583	270	120
123	550	470	320	130
145	650	470	320	150
170	750	470	320	170
245	1050	620	582	280
420	1425	960	640	500
550	1550	960	640	600

7.06 Pre-Moulded Joint(PMJ)

The construction of oil immersed terminations is based on the EPR(Ethylene-Propylene Rubber) or LSR(Liquid Silicone Rubber) - based stress relief cone and the epoxy housing. This is similar to gas insulated sealing end. But they use shield ring with insulating paper or epoxy insulated layer to prevent flashover in transformer. They are mechanical devices to maintain the interface pressure. Stress relief cone and mechanical devices are designed to fit with controlled interference over the cable insulation and is able to follow the cable's diameter variations still guaranteeing under any service condition a sufficient positive pressure to control the electric field concentration. The main insulation components are fully examined and tested in the factory. Dimensions of base paste are complying with various needs of customers. They are currently available at the voltage range up to 500kV and the maximum allowable size is 3000mm²(6000kcmil).

Rating & Dimension

Max. Voltage	BIL	Max. Height	Dimension of base plate	Max. Weight
kV	kV	mm	mm	kg
72.5	325	686	270	130
123	550	841	320	140
145	650	841	320	180
170	750	841	320	180
245	1050	1040	582	280
420	1425	1440	640	520
550	1550	1440	640	620

Coffin Box Type

7.07 Link Box

Metallic Casing & Coffin Box Type

The single piece pre-moulded type rubber joint is based on silicone insulation embedded with two semi-conductive stress relief cones and one high voltage electrode. Without any mechanical devices, the interface pressure is safely maintained with elastic retention of material itself. Semi-conductive stress relief cones and electrode are designed to fit with controlled interference over the cable insulation and is able to follow the cable's diameter variations still guaranteeing under any service condition a sufficient positive pressure to control the electric field concentration. Upon request of the customer, outer casing is designed (metallic casing, coffin box, and metallic casing with coffin box). They use filling compound in outer casing. In case of sheath sectionalizing joint, we use insulating plate made of epoxy or FRP to disconnect between cable sheaths. The main insulation components and outer casing components are factory-made and fully tested before delivering to the site. The cost-efficient and simplified design along with easy and fast installation meets the various needs of customers. Installation tools can be provided if requested by customers. They are currently available at the voltage range up to 500kV and the maximum allowable conductor size is 3000mm²(6000kcmil).

Rating & Dimension (Based on Coffin Box Type)

Max. Voltage	Max. Length	Max. Outer Dia.	Max. Weight
kV	mm	mm	mm
72.5	2000	500	90
123	2000	500	120
145-170	2000	500	150
245-300	2200	550	200
362-420	2600	700	300
550	2700	700	400

Buried Type : Link Box for cross bonding(3-1Way)

Gantry Mounted Type : Link Box for Earthing(3-1Way)

7.08 Transition Joint

Link Boxes are used at the end of cable termination to gain easy access to the cable metallic sheath and to limit the transient over-voltage induced on the metallic sheath by the lightning, switching operations and fault currents. Cross bonding(C.B.) link boxes allow metallic sheath to be transposed at cable joints with surge voltage suppression and reduction of circulation currents. Sheath voltage limiters(SVLs) in link box are the gapless ZnO arresters, which have the insulation resistance above 100MΩ at test voltage so that the sheath insulation can be checked without disconnection SVLs.

Standard Product	Box Type	Approx. Size mm	Bonding Lead	Approx. Weight kg
Link Box for Earthing(1-1Way)	Gantry Mounted / Buried	150X150 200X200	Single Core	15 30
Link Box for Earthing(3-1Way)	Gantry Mounted / Buried	300X500 350X600	Single Core	30 50
Link Box with SVLs(3-1Way)	Gantry Mounted / Buried	450X500 500X550	Single Core	40 70
Link Box for Cross-Bonding (3-1Way)	Gantry Mounted / Buried	500X550 550X600	Concentric	50 80
Link Box for Bonding & Earthing (3-1Way)	Buried	700X500	Concentric	80
Link Box for Earthing with SVL (3-1way)	Buried	700X500	Concentric	50

The transition joint connects between existing oil-filled cables and extruded dielectric cables. They comprise the stop joint with oil-impregnated paper insulation and epoxy bell mouth at side of oil-filled cables. They also comprise prefabricated type joint with stress relief cone based EPR(Ethylene-Propylene Rubber) and mechanical devices at side of extruded dielectric cables. They are designed to fit with controlled interference over the cable insulation and is able to follow the cable's diameter variations still guaranteeing under any service condition a sufficient positive pressure to control the electric field concentration. Each components fully examined and tested in the factory. They are currently available at the voltage range up to 300kV and the maximum allowable cable conductor size is 3000mm²(6000kcmil).

Rating & Dimension

Max. Voltage kV	Max. Length mm	Max. Outer Dia. mm	Max. Weight mm
145	1800	290	220
170	1800	320	250
245	2000	360	300

7.09 Optical Cable & Joint

These type for power cable are very useful to measure distributed temperature. Especially optical cable located the sensing fiber to the cable core provides a better indication of conductor temperature. We can supply optical joint to connect optical fiber cable.

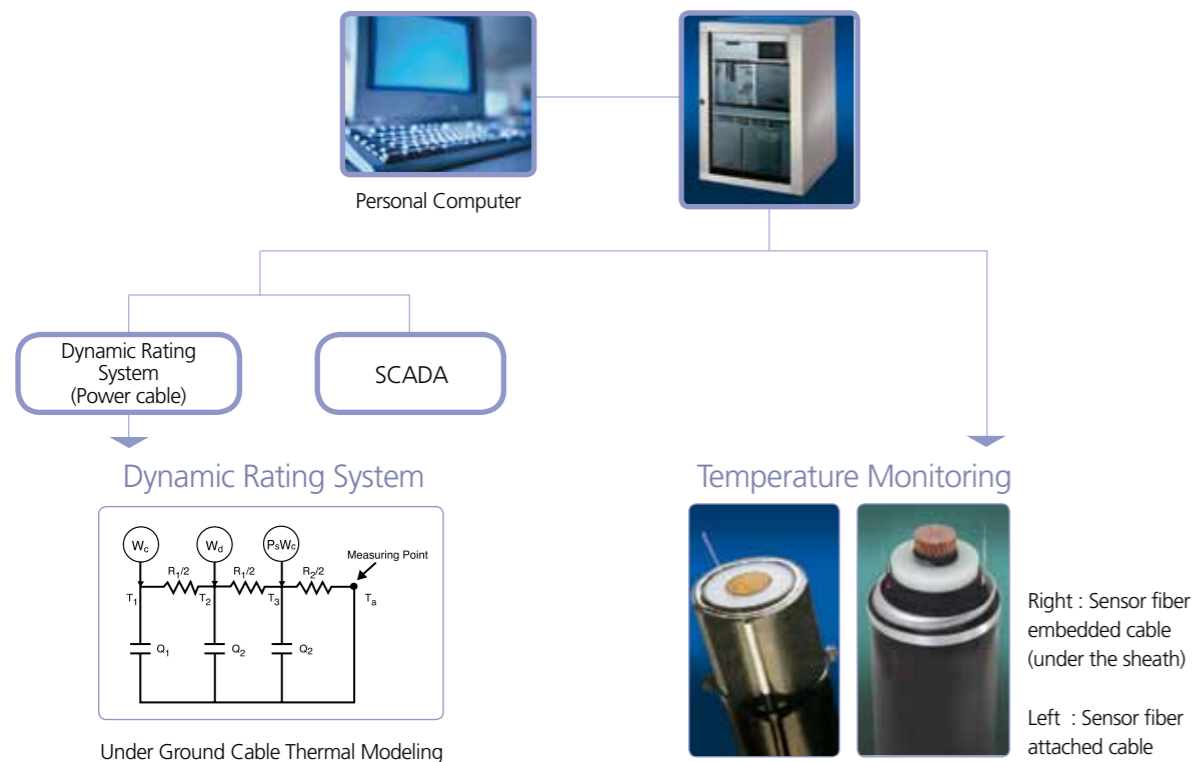

8.00 Monitoring & Diagnosis System

- 8.01 Real Time Thermal Monitoring-Underground Power Cable System
- 8.02 On-Site PD Detection System

8.01 Real Time Thermal Monitoring-Underground Power Cable System

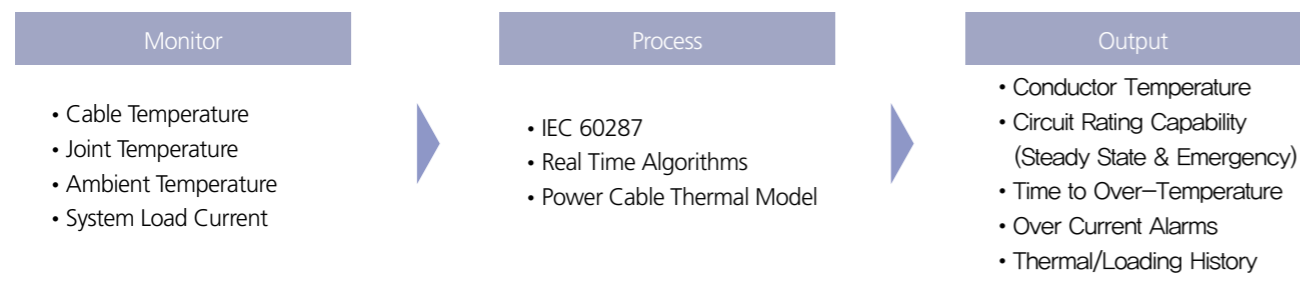

Real time thermal monitoring cooperated with DTS* system using optical fiber as the sensor provides high efficiency and reliability of power cable system.

Thermal models and real-time temperature measurement can provide dynamic rating system. And this system allows qualification of actual cable capacity, cable conditions and environmental parameters critical to the stability and longevity of the cable system.

These types of power cable are very useful to measure distributed temperature. Especially, the right cable, located the sensing fiber closer to the cable core, provides a better indication of conductor temperature.

Dynamic Cable Rating Systems (R-TAS™)

*Distributed Temperature Sensor : Supplied by Sensa, UK. For more information, refer to www.sensa.org

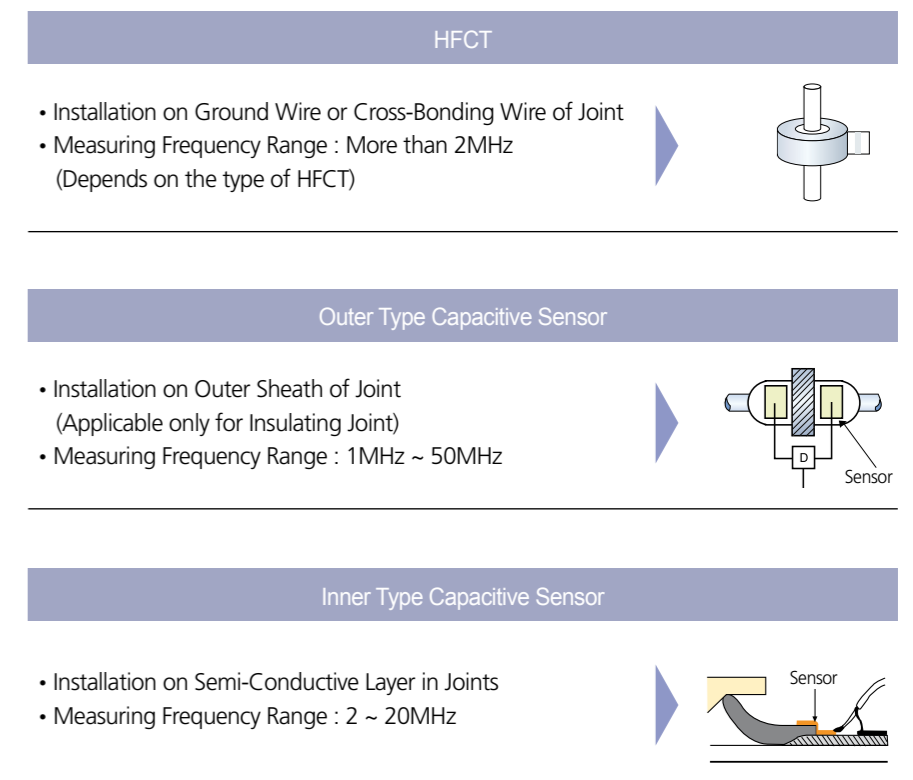

8.02 On-Site PD Detection System

On-Site PD Detection based on high frequency PD measurement can be a highly effective method to increase the reliability of XLPE power cable system not only as after-laying test but also as on-site insulation diagnosis.

Characteristics of On-Site PD Detection System

- High sensitivity by tuning low noise frequency range
- System configuration without line-off
- Easy installation of PD sensor
- Pattern recognition by ϕ -q-n analysis
- PD localization using PD attenuation property
